USP's OF Deli Nature

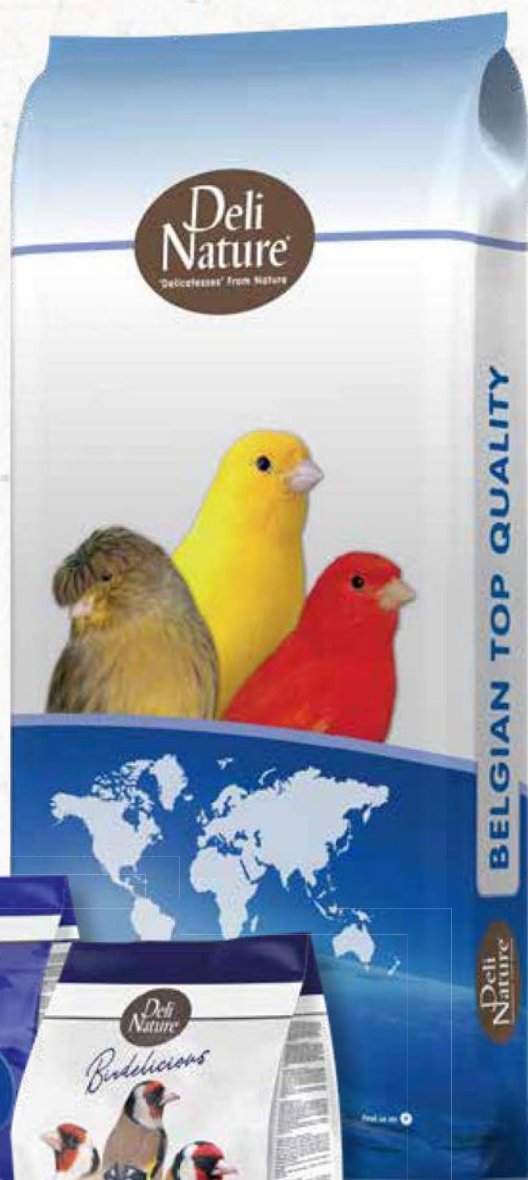

1. Professional collaboration

Product development and continuous optimization play an important role at Deli Nature. We work closely with universities, veterinarians, nutritional experts/ nutritionists and fanciers all over the world, all of whom provide their practical experience.

2. Excellent quality

The production process at Deli Nature is carried out in accordance with GMP-ISO standards. The unique cleaning process guarantees the purest mixtures on the market. Our own laboratories, as well as external organizations, closely monitor the quality of the end product.

3. The customer is king

The fancier/bird breeder is the key to our success. We ensure that a complete range of high-quality products for birds find their way to their fans. They can be assured that they always have the best product at the right time, the right place and all for the best price/quality ratio.

Passion for nutrition

In order to compose the most ideal mixtures, Deli Nature looks at what birds eat in their natural environment. Together with passionate hobbyists, specialized breeders, bird vets, universities, nutritionists and nutritional experts, the most complete feed for each type of bird is researched.

HOUSING:

breeding cage, aviary. This has a strong influence on the portions that the birds should be given.

CLIMATE:

the temperature has an important influence on the feeding pattern of the bird.

FANCIER/BREEDER:

- Optimal care = RATIONING !
 - Avoid selective eating
- Natural feeding
 - Adaptive feeding depending the specific periods of the year = natural rhythm
 - Highlight of the year = breeding season
 - Germinated, soaked and/or boiled seeds
 - Insects
 - Eggfood & supplements

PERIOD OF THE YEAR:

according to the period of the year, the bird has a completely different feeding pattern.

Rest period: light feeding - maintenance.

Moulting period: extra vitamins to support feather composition.

Breeding period: germinated seed, eggfood ... to ensure that the birds are in top condition for breeding and rearing their young.

The Australian Red-Browed Finch, looking for food in his natural habitat 'The Grampians'

STRAIGHT SEEDS

PLAIN CANARY SEED:

- Belongs to the family of grass seeds. Is an important ingredient in the majority of bird mixes.
- Plain canary seed EXTRA is additionally cleaned and is of an exceptional quality. Unique on the market!
- Excellent for all seed-eating birds.

NIGERSEED

- Is appreciated by the majority of bird species. Very nutritional seed.
- Very high germination capacity.
- Excellent for all seed eating birds.

RAPESEED

- Seed with a sweet taste and high protein content. Is also a fat-rich seed.
- Contains natural colourings, therefore be careful with certain types of birds (e.g. mosaic canaries ...).
- Is often used for germination e.g. for American siskins.
- Excellent for canaries, British finches.

BLACK RAPESEED

- Also called 'bitter rapeseed', larger and darker in colour than rapeseed.
- Excellent for canaries, British finches.

HEMPSEED

- Seed with a high protein content. Stimulates the birds' nesting instinct. Feed in moderation to prevent the birds becoming too excited.
- Excellent for all seed-eating birds.

BUCKWHEAT

- Seed with a low fat content and high proportion of carbohydrates.
- Excellent for large types of British finches, large parakeets and parrots.

SAFFLOWER

- Is member of the family of thistle seeds.
- Is often used for germination.
- Excellent for large types of British finches, large parakeets and parrots.

WHITE/BROWN PERILLA

- Is appreciated by the majority of bird species. Is a fat and protein rich seed and has a sweet taste.
- Excellent for canaries, British finches.

WHITE/BLACK LETTUCE SEED

- Is a small oil-containing seed with a high protein content.
- Excellent for British finches.

WHITE/STRIPED/BLACK SUNFLOWERSEED

- Fat-rich seed available in different formats.
- British finches like to eat black sunflower seeds.
- Parakeets and parrots mostly eat white and striped sunflower seeds, but parrots have a preference for white.

LA PLATA MILLET

- Is the most common type of millet. Has a high carbohydrate content.
- Is appreciated by the majority of bird species.
- Excellent for canaries, British finches, foreign finches, budgies and large parakeets.

KATJANG IDJOE

- Also known as mung beans. Belongs to the soy bean family.
- Ideal for germination.
- Germinated ideal for canaries, British finches, foreign finches, budgies, large parakeets and parrots.

CONSTRUCTION AND OPERATION OF THE GASTRO-INTESTINAL TRACT IN BIRDS

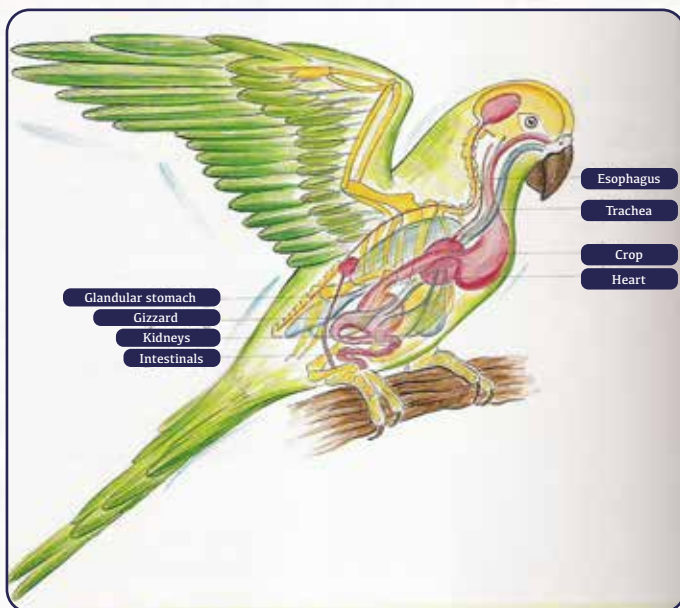

- The construction and operation of the gastro-intestinal tract of birds is completely different to mammals.
- It is extremely important for the health of your birds that the provided feed is tailored to the digestive system

the digestive system is composed of:

the beak, the crop, the glandular stomach and the gizzard

Each has their own specific task in the absorption and digestion of the provided food.

We must ensure that each part can carry out its function as correctly as possible.

BEAK: How a bird eats, depends on the type of bird. Certain types eat the seed and shell; others will use their beak and tongue to peel the seeds and leave the shell. Often, they will press the seed with their tongue against the hard palate to break it.

CROP: is a sacklike widening of the oesophagus and is on the right-side of the neck just before the entry to the chest. The eaten food is stored and presoaked in the crop.

GLANDULAR STOMACH: is an organ with a lot of glands which emit digestive juices and stomach acids on the pre-soaked seeds. The feed stays briefly in the glandular stomach, so that the juices can work on it. Thereafter the feed is transported to the gizzard.

GIZZARD: is a round organ with a thick wall constructed of muscles. This is the last phase of the process before it goes to the intestinal canal. The inside of the gizzard is covered with a very hard lining with a rough surface. The gizzard contracts strongly: together with the rough lining, this ensures that the food is ground down. If the food is already too far processed when it arrives in the gizzard, it will no longer have to carry out its function of continuously grinding the food. This causes thinning of the wall and slackening of the gizzard.

In order to support and strengthen the grinding action of the gizzard, the birds must always have **BIRD GRIT** and **STOMACH GRIT**. This is indispensable and is unfortunately often forgotten.

The finely ground food then arrives in the small intestine where bile and pancreatic juices are added which further break down the food so that it can be absorbed. In the large intestine, excess water is reabsorbed into the body.

A difference should be made between birds that are seed-eaters and soft-food eaters.

- Seed-eaters have a longer gastro-intestinal tract as they have to digest a lot more carbohydrates.
- Softbills have a much shorter gastro-intestinal tract and digestion is much quicker. This of course influences the food which needs to be provided.

 **TIP:** Pellets are a good complementary feed for birds. But seen their digestive tract it is not a complete food.

Sprouted seeds: a wealth of nutrients!

Sprouted seeds have their supporters and opponents. However, it has been proven that sprouted seeds are an enormous source of nutrients.

Sprouted and soaked seeds are

- much softer in structure
- are very well appreciated and eaten by all birdspecies
- are highly digestible

Freshly sprouted seeds are a source of vitamins (A, B and E) and digestible nutrients. Vitamin E is also known as the fertility vitamin.

Thanks to the physical changes caused by the germination of seeds and the high level of moisture, these seeds are much more digestible, which is very important for young birds.

How to germinate seeds?

- The seeds must first be washed well under running water so that they are completely clean.
- The seeds must be left to soak and swell in lukewarm water for 12-24 hours. This is best done at room temperature or in the vicinity of a heat source.
- After the seeds are saturated, rinse them abundantly with lukewarm water. Pay sufficient attention so that the seeds are properly cleaned.
- The rinsed seeds are put in a sieve or sprout dish and these are left to germinate for about 24 hours in a warm location or in the vicinity of a heat source. Create a closed circuit from your sieve or sprout dish by covering this with a lid, wet cloth ... This encourages the germination process. When the seeds germinate, these can be fed to the birds pure or mixed with eggfood.

 **TIP:** keep the formation of bacteria and mould to a minimum during the germinative process, it is advisable that the water in which the seeds are being soaked is made acidic (e.g. with **BEYERS PLUS HERBA-ZYMA**, a mix of organic acids and enzymes). This will suppress all the negative processes during soaking and sprouting.

 **TIP:** Don't leave your seeds to sprout for too long. Generally, it is assumed that the smaller the sprouts, the greater the nutritional value. Therefore try to feed the seeds when the sprouts are about 1-2mm.

 **TIP:** When the sprouted seeds are dispensed, they can be sprinkled with **FLORA+**. The lactobacillus and enzymes will suppress the negative bacteria and the good bacteria will come to life thanks to the increased moisture level from the sprouting seeds making them become active in the crop.

Preparation Cooking Mix:

1. Rinse the seeds well
2. Boil the seeds for 35 to 45 minutes at 100°C
3. Rinse the seeds well again
4. Let the seeds cool down and then feed them to your bird

Excellent eggfood & softfood

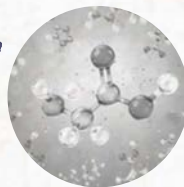

With extra
oregano

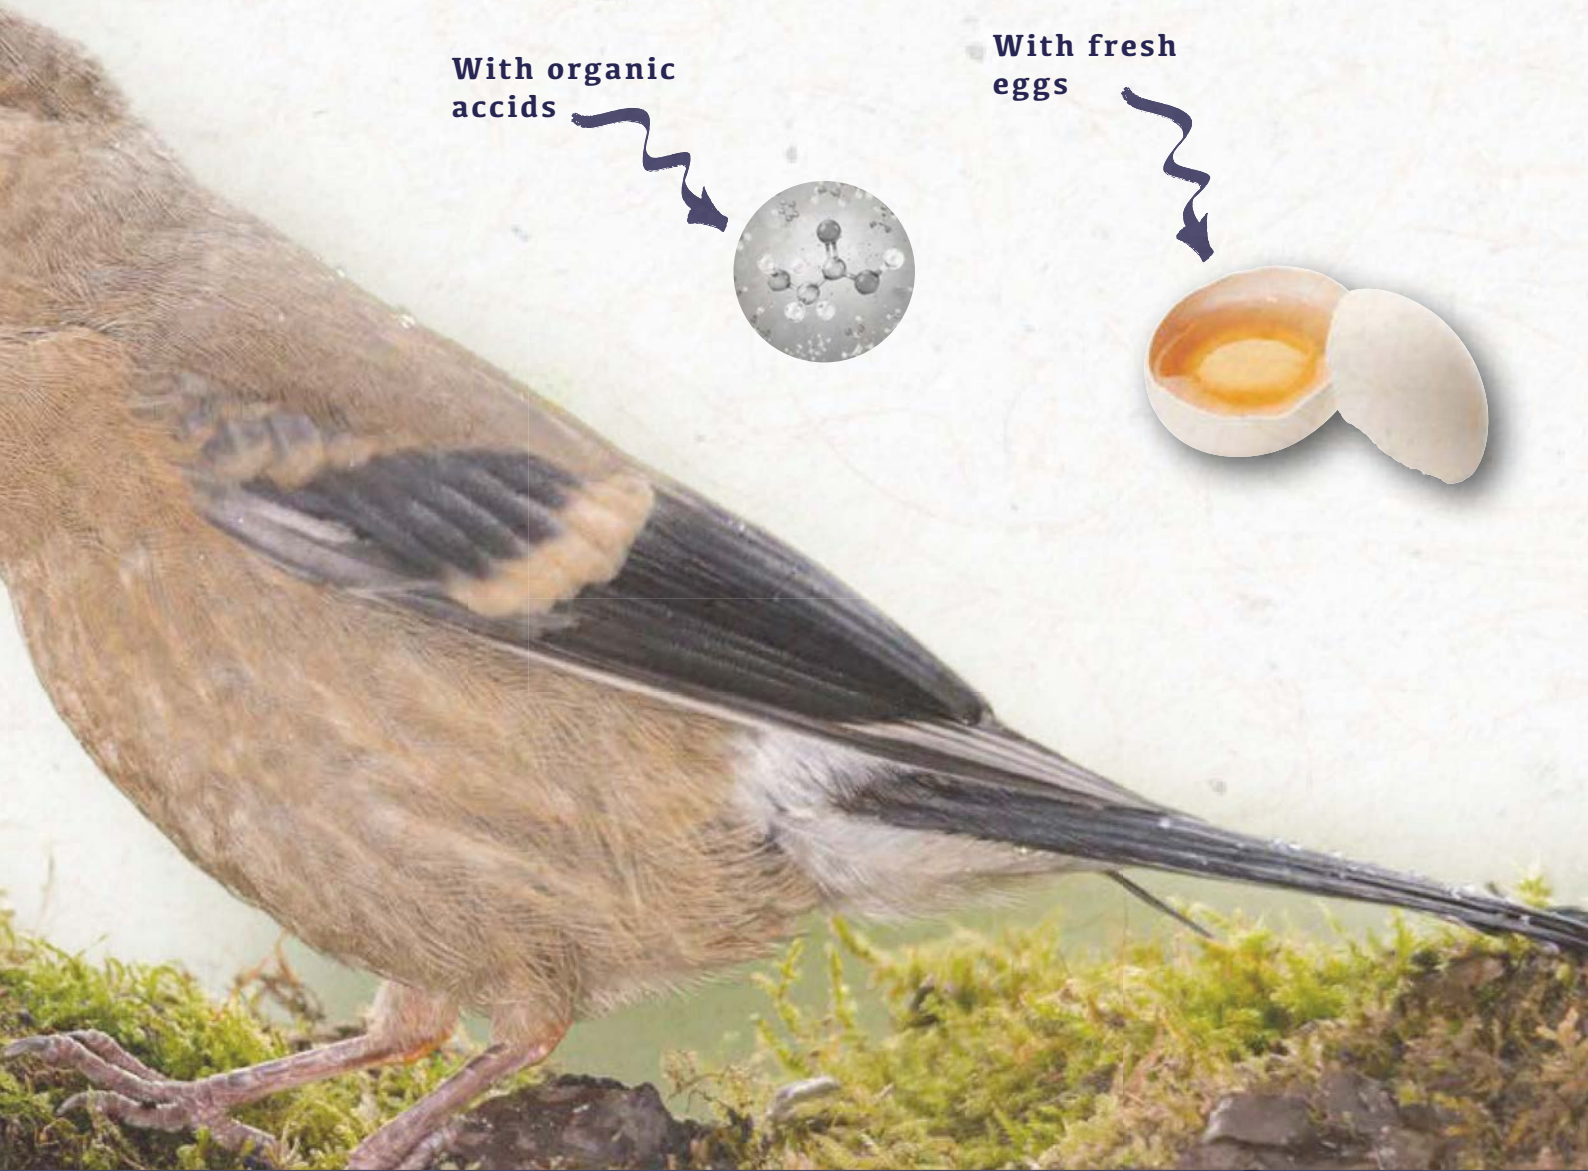

With 100%
natural honey

With organic
acids

With fresh
eggs

Excellent eggfood canaries & foreign finches

EGGFOOD YELLOW DRY 1 & 10KG

- excellent eggfood based on fresh eggs
- perfectly suited for the breeding and nurturing of all types of canaries
- best prepared with germinated seeds, grated fruit/vegetables
- for British finches enrich the eggfood with live or frozen insects such as buffalo worms, mealworms
= a high percentage of animal protein

REARINGFOOD BIANCO MOIST 1 & 10KG

- excellent rearingfood for white, pale and mosaic canaries
- contains no colorants and is developed to avoid colorations
- ready for use by adding 100% natural honey
- higher amount Vitamin A
- ideal for pale mutations of British finches
- for British finches enrich the eggfood with live or frozen insects such as buffalo worms, mealworms
= a high percentage of animal protein

EGGFOOD YELLOW MOIST 1 & 10KG

- excellent eggfood based on fresh eggs
- ready for use by adding 100% natural honey
- perfectly suited for the breeding and nurturing of all types of canaries perfect
- for British finches enrich the eggfood with live or frozen insects such as buffalo worms, mealworms
= a high percentage of animal protein

EXCELLENT MIXTURES FOR
CANARIES AND FOREIGN FINCHES

TOP SUPPLEMENTS

EGGFOOD RED MOIST 1 & 10KG

- **EGG FOOD IS WHITE IN COLOR!!!**

- enriched with β -carotene and Canthaxantin to maintain and support the red plumage of your birds
- ideal for colour canaries & British finches who have the red factor
- ready for use by adding 100% natural honey
- perfectly suited for the breeding and nurturing of canaries with the red factor
- for British finches enrich the eggfood with live or frozen insects such as buffalo worms, mealworms
= a high percentage of animal protein

EGGFOOD FOREIGN FINCHES MOIST 1 & 10KG

- excellent eggfood based on fresh eggs
- ready for use by adding 100% natural honey
- perfectly suited for the breeding and nurturing of all species of foreign finches
- fine structure for a complete assimilation
- enriched with fresh water shrimps
= a high percentage of animal protein

INSECTPATÉ TOVO 500 G & 6KG

- complete food for insect eating birds like bluethroat, nightingale, wagtail,... and waders
- large variation in insects : dried mealworms, crickets, freshwater shrimps, daphnia,...
- 100% ready for use insect food
- ideal complementary food for all bird species that need extra animal protein in preparation of and during the breeding season

Excellent eggfood budgies, parakeets, large parakeets & parrots

EGGFOOD PARAKEET DRY 1 & 10KG

- excellent eggfood based on fresh eggs
- perfectly suited for the breeding and nurturing of budgies and small parakeets species
- best prepared with germinated seeds, grated fruit/vegetables
- enriched with fresh water shrimps
= a high percentage of animal protein

EXCELLENT MIXTURES FOR
PARAKEETS, LARGE PARAKEETS AND PARROTS

TOP SUPPLEMENTS

EGGFOOD LARGE PARAKEETS & PARROTS MOIST 800 G & 10KG

- excellent eggfood based on fresh eggs
- ready for use by adding 100% natural honey
- perfectly suited for the breeding and nurturing of large parakeets and parrot species
- enriched with raisins and mountain ash berries
- enriched with fresh water shrimps
= a high percentage of animal protein

INSECTPATÉ TOVO 500 G & 6KG

- complete food for insect eating birds like bluethroat, nightingale, wagtail,... and waders
- large variation in insects : dried mealworms, crickets, freshwater shrimps, daphnia,...
- 100% ready for use insect food
- ideal complementary food for all bird species that need extra animal protein in preparation of and during the breeding season

FRUITPATÉ TOVO 1 & 10KG

- coarse softbillfood for all types of fruit eating birds such as starlings, jays, turacos, toucans
- ideal supplement for loris, fig parrots and all large parakeets and parrots which will benefit from it
- an iron content of less than 80ppm (One of the most important causes of death amongst fruit-eating birds is a build-up of iron in the liver)
- high percentage of natural honey which ensures that it is very tasty
- variation in fruit (pineapple, papaya), berries (rowan and juniper) and raisins

Excellent softfood fruit- & insecteating birds

INSECTPATÉ TOVO 500 G & 6KG

- complete food for insect eating birds like bluethroat, nightingale, wagtail,... and waders
- large variation in insects : dried mealworms, crickets, freshwater shrimps, daphnia,...
- 100% ready for use insect food
- ideal complementary food for all bird species that need extra animal protein in preparation of and during the breeding season

UNIPATÉ TOVO 1 & 10KG

- complete food that meets the nutritional demands of small frugivorous birds
- low iron content (< 80ppm)
- fine softbillfood for small species of fruit eating birds such as pekin robins, bulbuls, tanagers, thrushes and blackbirds
- ready for use by adding 100% natural honey
- ideal for supplementing the daily feed of British finches, small and large parakeets.

FRUITPATÉ TOVO 1 & 10KG

- coarse softbillfood for all types of fruit eating birds such as starlings, jays, turacos, toucans
- ideal supplement for loris, fig parrots and all large parakeets and parrots which will benefit from it
- an iron content of less than 80ppm (One of the most important causes of death amongst fruit-eating birds is a build-up of iron in the liver)
- high percentage of natural honey which ensures that it is very tasty

HANDREARING FOOD

Handrearing food has truly caused a big change in the world of bird breeding. It is the solution for numerous problems encountered during the breeding of birds.

In bird breeding in general, things have become much more professional during the last few decades. Keeping and breeding exclusive and costly birds, a higher number of eggs because of better feed, multiple sittings per year... and not to forget the hand tame indoor birds have caused a tremendous rise in the demand for hand rearing food.

Hand rearing can be done in different ways. It can be done with a small spoon (sides bent), via injection or with a crop tube. Depending on the type of bird and the preference of the bird lover, the birds can be fed by hand.

Hygiene is the most important aspect during the hand rearing. As a bird lover, one needs to ensure that all recipients and containers are clean (spoons, injection devices, pots, brooders,...). Ideally, all recipients used should be cleaned in between different feeding sessions in order to keep the chances for infection as little as possible. If this is not done well enough, the vulnerable chicks will be more prone to contract infections, with disastrous consequences.

Other elements we need to take into account as a bird lover:

1. **The temperature.** Depending on the type and age, it should be between 39°C and 43°C.
2. **The feeding frequency.** This depends on the age of the chick, the thickness of the mash and the way of feeding. Newborn chicks in their first week need to have a thinner mash every two hours. Afterwards, the mash can become thicker and the feeding can be done every four to five hours. The best indication is crop emptying. Make sure the crop is empty when feeding again. This is to minimise the formation of acid and crop fungus.
3. **Quantity.** The amount of hand rearing feed to be given to the baby birds depends on various factors. As a rule, give 10% of their weight per feed. Obviously, this is also depending on the bird species.

TIP: We advise as from day one after hatching to give a few drops of water with FLORA+, yoghurt whey,... This will avoid dehydration of the baby and will allow the crop and intestinal flora to work. As from the second day, the mash can be given in very thin consistency. Ideally, one can add more FLORA+ during the first week in order to support digestion.

TIP: It is better to have the mash a bit more runny to stimulate good digestion and give one feed per day more!

ATTENTION: Always prepare fresh mash for each feeding!

Deli Nature START+ has a slightly coarser structure (< 2mm). After a few days, the parents will be picking peeled seeds. Thanks to the coarser structure of START+ we are imitating nature as closely as possible. This stimulates the function and the working of the crop and optimises the digestion of the feed.

START+ HIGH PROTEIN

500 G & 2,5 KG

22,5% Crude protein and 9% fat - With Bacillus Subtilis

Suitable for all bird types with a high need for proteins, such as lovebirds, large parakeet, amazon, white cockatoo,... Start+ HP contains all nutrients to guarantee good growth and a well-balanced development of the babies. The added probiotic (Bacillus Subtilis) as well as the prebiotics support the crop- and intestinal flora and optimise the digestion of the feed. The presence of DHA (essential fatty acids) contribute to an optimal omega-6 and omega-3 balance and supports the resistance against pathogenic bacteria. The presence of organic acids ensure an ideal acidity environment in the crop.

Ideal for the feeding of smaller species in the nest, like canaries, British finches, ...

START+ HIGH ENERGY

500 G & 2,5 KG

19,5% Crude protein and 14% fat - With Bacillus Subtilis

Suitable for all types of birds with a high need for energy such as African grey, eclectus parrot, macaws, black cockatoo, golden conure,... and all baby birds of less than nine days of age. Start+ HE contains all nutrients to guarantee good growth and a well-balanced development of the babies. The added probiotic (Bacillus Subtilis) as well as the prebiotics support the crop- and intestinal flora and optimise the digestion of the feed. The presence of DHA (essential fatty acids) contribute to an optimal omega-6 and omega-3 balance and supports the resistance against pathogenic bacteria. The presence of organic acids ensure an ideal acidity environment in the crop.

FEEDING SCHEME - DELI NATURE START +

HATCHING - DAY 4	1 part START+	5 parts lukewarm water
DAY 5 - DAY 13	1 part START+	4 parts lukewarm water
DAY 14 - WEANING	1 part START+	3 parts lukewarm water

SUPPLEMENTS

The keeping and breeding of birds has evolved a great deal over the past few decades. Previously more common species of birds were kept as a hobby. This still happens today, but in addition to this, enthusiasts are taking up the challenge of keeping and breeding highly exclusive species of birds, are specialising in mutation breeding or are focusing on shows aimed at breeding the most perfect bird possible. This evolution also poses the need for much higher requirements in terms of feed for our feathered friends and this has resulted in the unique, user-friendly Deli Nature range of supplements.

Breeding of exclusive species of birds

Birding has not stood still. More and more enthusiasts are taking up the challenge posed by keeping highly exclusive species of birds which previously would only have been seen in bird parks and zoos, and also breeding them. For these species of birds, food is the key to success. By feeding the birds as well as possible and ensuring that they are healthy, they are more likely to reproduce in captivity. In this respect, the provision of supplements is clearly no luxury.

Mutation breeding

The keeping and breeding of mutations is also very much here to stay in bird breeding. True specialists focus on continuously breeding new variations of feather colouring. This can sometimes take years. It is known that a colour mutation is always more sensitive, and is weaker than the wild colour. For this reason, it is extremely important for both breeding birds and in particular the mutants to always have a balanced diet. In this respect, the provision of supplements in the form of vitamins, condition preparations etc. is essential.

Enthusiasts are focusing on shows

Here the aim is to breed the perfect bird, which matches the standard requirements as closely as possible. These enthusiasts impose very strict requirements on their birds and occupy themselves very intensively with breeding. They attempt to obtain the maximum 'output' from their breeding couples, which in itself again demands a lot from the birds. This means that the birds have to be looked after as well as possible and that they need to have all the necessary nutrients in their feed, and in the correct quantities. These birds need to be given extra supplements so that they are in the best possible condition in order to produce these extreme performances. This can be compared with the performance of a leading athlete.

BASIC SCHEDULE FOR THE DELI NATURE SUPPLEMENTS

EXCEPTIONS
After shows: on a daily basis for 1 week
After a course of antibiotics: on a daily basis for 2 weeks.
In case of a calcium deficiency, egg binding, thin egg shells ...: 6 g of Calcio+ per 100g of eggfood or in 250 ml of drinking water for a 4 week period
In case of calcium tetany: daily 6 g Calcio+ per 100 g eggfood or 250 ml drinking water

* Tetany is a disease which is characterized by the involuntary contraction of certain muscle groups, caused by lack of calcium in the blood. The reduced calcium levels (hypocalcemia) can have different causes: for example lack of Vitamin D.

V+ = Vitamino+

F+ = Flora+

C+ = Calcio+

B+ = Breed+

VITAMINO+

250G

VITAMINO+ is a top quality food supplement, developed in collaboration with veterinarians, nutritionists, scientists and prominent breeders. It effectively complements a healthy diet and is perfectly tailored to suit your birds' needs. Vitamino+ has a unique composition with a **high content of essential amino acids**. These amino acids cannot be synthesized in the body and therefore need to be included in the food. The added **organic trace elements** have a higher bioavailability and are therefore better absorbed by the birds' body. Vitamino+ contains top quality vitamins and minerals. It also contains dextrose instead of lactose. This is very important as birds cannot digest lactose the same way mammals do.

Instructions for use:

- Add 1g per 100g of egg food 3 x per week throughout the year
- Add 1g per 100g of egg food combined with Deli Nature BREED+ on a daily basis in preparation for and during the breeding season
- Add 1g per 100g of egg food for 1 week after returning from exhibitions
- Add 1g per 100g of egg food for 2 weeks after treatment with medication

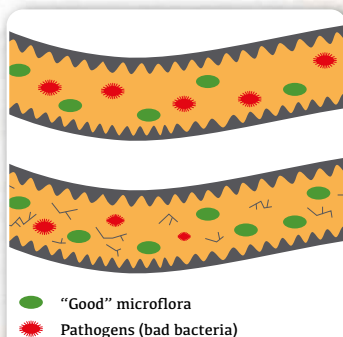

TIP: Do not dissolve in drinking water. Administer VITAMINO+ in combination with eggfood, germinated seeds or fruit.

WITH ORGANIC
TRACE ELEMENTS

WITH PRE- AND
PROBIOTICS

Butyric acids keep the intestinal wall healthy and stimulate the growth of good bacteria.

FLORA+

250G

FLORA+ is an intestinal conditioner with probiotic effect, developed in collaboration with veterinarians, nutritionists, scientists and prominent breeders.

FLORA+ functions in 3 ways

1. It supports healthy intestinal flora

FLORA+ is a combination of probiotics (*Bacillus Subtilis*) and prebiotics, to stimulate healthy intestinal flora.

FLORA+ contains threonin and butyric acid.

2. **Threonin** is an essential amino acid and therefore has to be administered via the food. 60 % of the absorbed threonin is used by the intestinal cells to develop the mucus. The mucus is an important part of the intestinal barrier protecting the intestines against damage of enzymes and other components in the food.

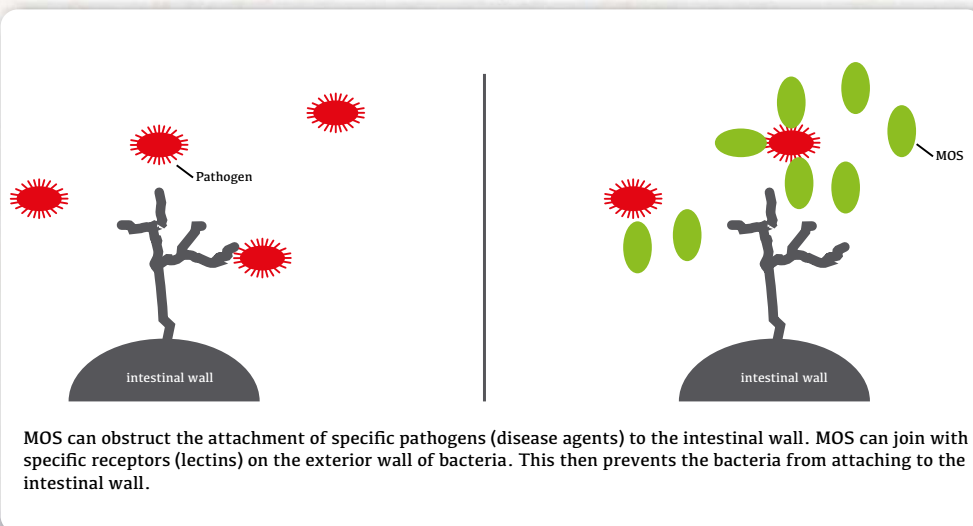

3. **Butyric acids** are very important as energy source for the intestinal cells.

Instructions for use:

- 1g per 150g egg food
- 1g per 100g hand rearing food

TIP: Thanks to the threefold working, this intestinal conditioner improves the resistance and supports the health of your birds. FLORA+ is also a perfect supplement during handrearing to create good and stable intestinal flora.

CALCIO+**500G**

CALCIO+ is a top quality food supplement, developed in collaboration with veterinarians, nutritionists, scientists and prominent breeders. This food supplement contains **10% calcium** in a form which can be optimally absorbed in the birds' gastrointestinal tract. The absorption of calcium via food depends highly on the form in which the calcium is present. Calcio+ has a combination of **4 high quality calcium sources** (calcium lactate, calcium citrate, calcium gluconate and calcium carbonate). Insufficient absorption of calcium via nutrition results in the body getting the needed calcium out of the skeleton, making them brittle and break easily.

The addition of **Vitamin D3** improves the absorption of calcium in the gastrointestinal tract and enhances the formation of the eggshell and the skeleton. On the one hand, vitamin D is partly absorbed through the food, on the other hand it is partly produced in the skin under influence of UV radiation from sunlight. Therefore it's important to add Vitamin D for birds which are kept inside and don't have any direct contact with sunlight.

Thanks to its unique composition, **CALCIO+** enhances the formation of good egg shells and supports the structure of the skeleton.

Instructions for use:

- In preparation of and during the breeding season 4 g per 100 g of egg food or 250 ml drinking water.
- In case of problems: e.g. calcium deficiency African grey, thin egg shells, ... 6 g per 100 g of egg food or 250 ml drinking water.

BREED+**500G**

BREED+ is a top quality food supplement, developed in collaboration with veterinarians, nutritionists, scientists and prominent breeders. **BREED+** has a unique composition of amino acids, minerals and vitamins. The added **organic trace elements** have a higher bioavailability and are therefore better absorbed by the birds' body. Thanks to the **high Vitamin E content (2500mg)**, it's ideal in the preparation of and during the breeding season. **BREED+** improves the fertility! The added anti-oxidants, including Vitamin E, protect the embryo and facilitate the hatching. **Folic acid** is ideal for the growth and development of the young birds. **L-carnitine** ensures better fertility and higher outcome percentage.

Instructions for use:

- In preparation of and during the breeding season daily 5g per 100g of egg food

BREED+ is best used in combination with **VITAMINO+**, in preparation of and during the breeding season.

ATTENTION: Follow the dosage mentioned on the label to ensure males don't become too aggressive. Once the hens are sitting on the eggs, stop giving Breed+

4 HIGH QUALITY
CALCIUM SOURCES
WITH VITAMIN D

WITH ORGANIC TRACE
ELEMENTS, L-CARNITINE
& FOLIC ACID
2.500MG VITAMIN E

Birds in nature searching for minerals and grit. This should certainly not be missing in captivity on the daily ration of our feathered friends.

MINERALS AND TRACE ELEMENTS

Just as with vitamins, minerals are necessary for various processes in the body. Minerals such as calcium form the main components of the skeleton and eggshell. The absorption of calcium from the feed can be negatively influenced by a phosphorus content being too high. The balance between calcium and phosphorus in feed should be between 1:1 and 2:1.

Trace elements are minerals which only need to be present in the feed in very small concentrations. The most important trace elements are zinc, iodine, manganese, iron, copper and selenium.

Iron is necessary in order to transport oxygen around the body in the blood. An iron deficiency can lead to anaemia. Selenium works together with vitamin E as an anti-oxidant. An iodine deficiency causes problems with the thyroid gland as well as respiratory problems due to the pressure of the swollen gland on the windpipe.

The complete Deli Nature eggfood range is supplemented with easily absorbable minerals and trace elements.

CALCIUM

Is important in the formation of bones and eggshells and plays a role in controlling the muscles. In the event of deficiencies in the feed, the body will collect calcium that it requires from the bones. Consequently, the bones become brittle and break easily.

In the case of the African grey, an illness called calcium tetanie occurs, when the body requires calcium but is not able to collect it from the bones. As a result, the birds suffer attacks falling from the perch and are very listless. These birds require extra calcium in their feed for the rest of their lives.

IODINE

This is necessary to make thyroxin. If there is too little iodine in the feed, the thyroid gland will enlarge as compensation. In birds, the thyroid gland is just below the neck, at the entry point to the chest cavity. Enlargement of the thyroid gland can result in the airway becoming partially closed leading to asphyxia. If the thyroid gland presses on the exit of the torso, there will be a delayed evacuation of the torso or the bird will regurgitate the feed that has been eaten.

SELENIUM

Selenium is a very important mineral for birds (and other animals), but only needed in small doses. Selenium (part of the enzyme: glutathione peroxidase) and Vitamin E work together as anti-oxidants to protect the cells against oxidative damage. Selenium supports fertility and the working of the immune system. Although selenium is an essential trace element, an excess of selenium may also be harmful. The seeds and grains used in the mixtures contain insufficient selenium and it is therefore necessary to administer extra selenium through the food for the birds, but take care with the dosage.

BIRD GRIT 1,2 & 20 KG

- Mix of grit, shells and coral
- Important for the good functioning of the muscular stomach
- Provide in unlimited quantities throughout the year

BIRD MINERALS 660 g

- Mix of different types of minerals
- Provide in unlimited quantities throughout the year
- Very important during preparation of the breeding period (for a solid egg formation) and during the rearing of the young (for a good skeletal construction)

PREMIUM SHELL SAND WHITE 5 & 20 KG

- Premium white floor covering enriched with anise for a pleasant smell
- Ideal as a floor covering in exhibition cages and traditional breeding cages.

SHELL SAND BROWN 5 kg & 20 kg

- Basic floor covering enriched with anise for a pleasant smell
- Ideal as a floor covering in exhibition cages and traditional breeding cages.

Deli Nature

Deli Nature would also like to take the opportunity to thank
ALL THE FANCIERS who have put their trust in our products.
